One segment delivered almost all of Vaisala's profit growth in 2026

EBITA bridge, January–September 2025 to January–September 2026, EUR million

93% of the EBITA increase came from Industrial Measurements: €14.3m of €15.4m

27.6% EBITA margin in Industrial Measurements, against 12.5% in Weather, Energy and Environment

€4m of the increase is a one-off US tariff refund, booked in the third quarter

The question this raises

What drives the uncertainty in the EBITA forecast: industrial demand, the timing of large weather projects, tariffs or currency?

The 2026 EBITA outlook moved from €95–110m to €110–120m between July and October. I would like to answer this in my master's thesis with Monte Carlo simulation and Simulation Decomposition on Vaisala's own data.
